Executive Summary

Over an **8**-day period, the website recorded **159** users consisting of both authenticated and unauthenticated visitors. The highest site traffic was observed on **29 November 2024**.

Basket activity analysis showed that the **Mobile** category recorded the highest number of items, followed by Laptops. Most users with basket activity were authenticated users, accounting for nearly twice the number of unauthenticated users, indicating stronger engagement and purchase intent among signed-in users.

Geographically, Lusaka contributed the highest number of users, exceeding the combined total from all other cities. This suggests that Lusaka represents the primary customer market during the observed period.

Additionally, only **2** out of **159** users returned to the website with basket activity across multiple dates, representing a purchase intent rate of **1.28%**.

These findings suggest that implementing automated sign-in options, such as **Google Sign-In or similar authentication methods**, could improve user tracking, increase basket-to-purchase conversion rates, and support automated remarketing strategies such as reminder emails for incomplete purchases.

Additionally presenting products mainly on the landing page may improve user engagement, product discovery, and conversion rates. Many successful e-commerce platforms prioritize featured products, categories, and purchase actions such as viewing products, clicking on product listings and adding items to a basket on the homepage. Relocating detailed business information to an "About Us" section could potentially increase click-through rates and basket activity.
